

Common ailments

Coughs and colds

There are some good things about catching a few coughs and colds - it helps build-up your natural defences and fight off viruses.

Most bugs will run their course without doing any real harm because they are viruses which get better on their own, however there are things you can do at home to help:

- Drink lots of fluids.
- Try paracetamol or Ibuprofen - always check the label for the correct information (children under 16 should not take aspirin).
- Keep away from smoke.
- Remember that coughing is the body's way of keeping the lungs clear.

Diarrhoea and being sick

Gastroenteritis, otherwise known as a stomach bug, or food poisoning is something you are likely to get at some point. Most cases resolve themselves within a few days, without the need for medical treatment.

Ensure you drink plenty of water so that you don't become dehydrated.

Be extra careful with hand hygiene (use soap and water and dry hands well with a clean towel).

If the gastroenteritis lasts for more than three or four days get advice from a health professional, such as your GP or pharmacist.

Headaches and migrane

Headaches

Headaches are quite common and most headaches are not due to a serious health problem. They can be brought on by skipping meals, not getting enough sleep, using computers, video games or other machines for a long time without breaks and occasionally from playing sport which can make you dehydrated. Sometimes headaches can be the result of stress brought on by things such as bullying or your parents splitting up. Most headaches can be treated at home with paracetamol or ibuprofen (always check the label for the correct dosage) and they can be avoided by making sure you get enough food, drink and sleep.

Migraines

Migraines are the most common cause of frequent headaches in young people. They often come on suddenly and as well as a headache you may feel sick, have tummy ache, or have changes to your vision. You may want to avoid bright lights and loud noises as the pain often gets better after a sleep. Migraines are not usually serious but can interfere with life so talk to your GP if you are having frequent headaches or if they are associated with other symptoms such as dizziness, vomiting and fever.

Acne

Around 80% of teenagers get some form of acne and there are many myths about what causes it. Acne consists of spots and painful bumps on the skin. It's most noticeable on the face, but can also appear on the back, shoulders and buttocks. Severe acne can cause scarring, so it is important to get treated.

Acne is mostly due to the way skin reacts to hormonal changes. Cases of teenage acne are thought to be triggered by increased levels of a hormone called testosterone that occurs during puberty.

Treatments are available from your pharmacy and if there is no improvement you should visit your GP who can assess how bad your acne is and discuss the options with you. If acne is severe your GP can refer you to a dermatologist (an expert in treating skin conditions). Treatments can take between two to three months to work but, once they do the results are usually effective.

Pharmacist says

You can also be treated using over the counter painkillers to help to bring down a raised temperature. Check with the pharmacist and tell them how old you are. Always check with your Pharmacist if you aren't sure which treatments you can take.

Who can help?

- Pharmacist
- GP
- School Nurse
